ABSTRACT

Design information is given to provide ship structural designers with convenient tabulations of the properties of built-up T-beams for the following high-strength materials: HY-80, HY-100, HY-130, and Ti 6Al-4V extra low interstitial. The T-beams are arranged in order of increasing sectional area for each material. Criteria for proportioning the T-beams are included in this report.

The unit system used in the tables is English. No attempt has been made to convert to metric units at this time since the majority of structural designs are still done in English units.

ADMINISTRATIVE INFORMATION

The work reported herein was authorized and funded by the Naval Sea Systems Command (03511) under Research Development Test and Evaluation Element 62534N, Task Area SF 43 422 593, Task 20445, Program Code 053, Work Unit title Advanced Ship Structures, Work Unit 1-1730-053-37.

INTRODUCTION

In its quest for faster and lighter ships, the Navy is investigating the use of materials with a high strength-to-weight ratio. Materials of primary interest are HY-80, HY-100, HY-130, and Ti 6Al-4V extra low interstitial (ELI).

Design information contained in this report was developed primarily for use in the structural synthesis design program (SSDP). 1,2 This publication, as a separate report, provides ship structural designers with convenient tabulations for built-up T-beams of higher yield material acting in combination with a range of plate sizes. A similar document for aluminum built-up T-beams was published in 1974.

Nappi, N.S. and F.M. Lev, "Midship Section Design for Naval Ships," NSRDC Report 3815 (1972). A complete listing of references is given on page 12.

²Walz, R.W. et al., "Manual for Use of Structural Synthesis Design Program," DTNSRDC Report 77-0032 (1977).

³Lev, F.M. and N.S. Nappi, "Properties of Combined Aluminum Beam and Plate," NSRDC Report 4336 (1974). 777 616

Dimensional limitations for T-beams made of high-strength steel and titanium were computed by the formulas contained in the U.S. Navy design data sheet. 4 By applying these dimensional limitations to the present mild steel beams used in the structural synthesis design program, it was found that approximately 50 percent of the beams in that catalog were unacceptable for use if made of HY-80, HY-100, HY-130, or Ti 6Al-4V ELI materials. Therefore, a definite need existed for developing T-beams with dimensions based on the properties of the higher yield materials. By using the built-up T-beams described in this report, more efficient structural designs can be produced for higher yield materials.

DETERMINATION OF EFFECTIVE PLATING WIDTH

When the plate is considered to be acting in combination with a T-beam, selection of an effective width of plating is based on the following formula 4

$$b_{eff} = 2t\sqrt{E/\sigma_y}$$

where E is modulus of elasticity

σ, is tensile yield strength

t is thickness of plate in inches.

Table 1 gives the values used for effective width for the various materials considered. The standard thicknesses of high yield plate available up to 2 inches are given in Table 2. Section properties listed in Appendixes A through D apply only when stiffener spacing is equal to or greater than effective width.

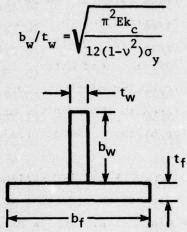

DIMENSIONAL PROPORTIONING

Proportioning of the T-beams was accomplished by using equations given in References 1 and 4. Use of these equations insured that local

⁴"Strength of Structural Members," Design Data Book, Department of the Navy, Bureau of Ships Classification DDS 9110-4 (1956).

buckling of the flange and web would not occur at less than the yield strength of the material. The following limitations have been imposed on the dimensions of the built-up T-beams.

The maximum web-depth-to-web-thickness ratio (b_w/t_w) is determined by

where E is modulus of elasticity

V is Poisson's ratio

 σ_{y} is yield strength

 $\boldsymbol{k}_{\text{C}}$ is coefficient dependent on plate aspect ratio, loading conditions, and boundary conditions.

TABLE 1 - DIMENSIONAL LIMITATIONS FOR T-BEAMS OF HIGH-YIELD MATERIAL

Material	Modulus of Elasticity psi	Yield Strength psi	Maximum Web Depth to Web Thickness b /t w w	Maximum Flange Width to Flange Thickness bf/tf	Effec- tive Width of Plating	Density lb/in. ³

1 3/8		(1.3750)
1 1/2		(1.5000)
1 3/4		(1.7500)
2		(2.0000)

The following assumptions were used to determine k.

- 1. The web aspect ratio is greater than 4, long and slender.
- 2. The limiting design-loading condition of uniform-edge compression is used.
- 3. The boundary conditions used are simply supported at the flange and fixed at the plate. With these assumptions, k_c =5.42.

A typical calculation for determining maximum $b_{\underline{w}}/t_{\underline{w}}$ follows:

$$\sigma_{y}$$
 = 80,000 psi for HY-80
E = 29 x 10⁶ psi for HY-80
v = 0.3
 $b_{w}/t_{w} = \sqrt{\frac{\pi^{2}(29 \times 10^{6})(5.42)}{12(1-0.3^{2})80,000}}$
 $b_{w}/t_{w} = 42$

The ratio of flange width to thickness is determined from

$$b_f/t_f = \sqrt{E/\sigma_y}$$

$$= \sqrt{\frac{29 \times 10^6}{80,000}}$$

$$b_f/t_f = 19$$

Dimensional limitations used in this report are given in Table 1.

CALCULATION OF MINIMUM-FLANGE-WIDTH-TO-WEB-THICKNESS RATIO

To produce the maximum local buckling strength of the web of a T-beam, the flange must have sufficient bending stiffness so that the web will buckle in the mode of a plate, simply supported along both edges. For this maximum web-buckling strength to be reached, the inertia of the flange

⁵Brockenbrough, R.L. and B.G. Johnston, "U.S. Steel Design Manual," (1974).

(I_f) must be determined by the larger of the following values:⁶ $I_{f} = 1.85 b_{f} t_{w}^{3} + 2.73 A_{r} t_{w}^{2}$ $I_{f} = 0.118 b_{w} t_{w}^{3} (a/b - 0.41)^{2} + 0.47 b_{w} t_{w}^{3} + 0.43 A_{f} t_{w}^{2} (a/b)^{2}$

where a/b is aspect ratio of the T-beam. (This study used a/b = 4.)

It was noted during the calculations that one could determine a minimum ratio of flange width to web thickness b_f/t_w necessary to provide a simple support at the intersection of flange and web. The calculations showed that a minimum value of 10 for the b_f/t_w ratio was required for this support condition.

ADDITIONAL CONSTRAINTS FOR BEAM SELECTION

The built-up T-beams listed in Appendixes A through D offer the ship structural designer a wide range of beam dimensions for design considerations. These ranges are as follows:

	Inche	es
	From	<u>To</u>
Range 1 - Web Depth	3	10
Flange Width	1	8
Web Thickness	0.1250	0.8750
Flange Thickness	0.1250	1.2500
Range 2 - Web Depth	12	18
Flange Width	4	12
Web Thickness	0.1250	1.2500
Flange Thickness	0.2188	1.5000
Range 3 - Web Depth	21	36
Flange Width	8	17
Web Thickness	0.3750	1.6250
Flange Thickness	0.4375	2.0000

Two additional constraints were used for final beam selection and have been presented in the following sections.

⁶Bleich, F., "Buckling Strength of Metal Structures," McGraw-Hill Book Company (Division of McGraw-Hill, Inc.) New York (1952).

INTERMEDIATE LATERAL SUPPORT

When a T-beam attached to a plate is subjected to bending and/or direct compressive stresses, there is the possibility of lateral buckling, i.e., laying over of the outstanding flange. To prevent this lateral buckling problem, a criterion of maximum permissible ratio of beam length to flange width has been established to provide adequate stability of the outstanding flange. This ratio of beam length (without intermediate lateral support) to flange width is given by the following equation

$$\frac{S}{b_{f}} = \frac{\frac{m\pi}{2\sqrt{3}} \sqrt{E/\sigma_{cr}}}{\sqrt{1 + \frac{1}{3} \frac{b_{w}^{t}w}{b_{f}^{t}f} - \frac{Et_{f}^{2}}{7.8 \sigma_{cr}^{c} b_{w}^{2}}}}$$

where S is safe length for stable T-beam

 σ_{cr} is critical buckling stress

m is a constant, depending on degree of end constraint

E is modulus of elasticity

Since it is desirable for a T-beam to retain its lateral stability until stressed to the yield point of the material, $\sigma_{\rm cr}$ was set equal to $\sigma_{\rm y}$. The constant m was set equal to $\sqrt{2}$ because the ends of the beam flanges are partially constrained in normal shipbuilding practices. ⁷

When the depth of the web and width of the flange are held constant, and the thicknesses of the web and flange are varied, the variation of safe beam length versus the cross-sectional area of T-beam is shown in Figure 1. It can be seen that as the area (weight) increases, some T-beam sections have a shorter safe length than had the previous T-beam section.

^{7&}quot;Design Data for Tee Stiffeners," Navy Department, Bureau of Ships Report 017969 (1944).

Since an increase in weight with a reduction in safe length is a penalty to the designer, only T-beam sections along the dotted line in Figure 1 have been chosen.

EFFECIENT SECTION MODULUS DETERMINATION

Plate and beam combinations used in ship structures are subjected to both axial compressive and bending stresses. The equation for bending stress is

$$\sigma = \frac{M}{Z}$$

where o is bending stress

M is bending moment

Z is section modulus

The section modulii of plate-beam combinations for aluminum, mild steel and high-tensile strength (HTS) steel have been tabulated, for use by designers, in References 3 and 8.

For the higher strength steels and titanium, used in this report, the theoretically most efficient section modulus $(Z_{\rm EFF})$ was determined, as shown below, using the information from strength of materials. This section modulus is found when most of the material is as far from the neutral axis as possible.

$$Z_{EFF} = 1/2 \cdot A_{TOTAL} \cdot h$$

⁸"Manual of Properties of Combined Beam and Plate, Part I, Tees and Angles," Coordinated by the Society of Naval Architects and Marine Engineers for the Maritime Administration, U.S. Department of Commerce, and the Bureau of Ships, Department of the Navy, NAVSHIPS 250-443-1, Part I (updated).

⁹Timoshenko, S. and D.H. Young, "Elements of Strength of Materials," McGraw-Hill Book Company (Division of McGraw-Hill, Inc.) New York (1968).

The minimum section modulus (Z_{MIN}) for a plate-beam combination is then divided by the theoretically most efficient section modulus (Z_{EFF}) to determine the percent of efficiency of the plate-beam combination. Figure 2 is an illustration of the variation of percent efficiency (Z_{MIN}/Z_{EFF}) with selected T-beam for a typical thickness of plate. An arbitrary cutoff value can be selected to eliminate unnecessary (inefficient) plate-beam combinations. (This study used 50 percent.) The resulting plate-beam combinations were used in the remainder of the study.

Figure 3 shows minimum section modulus versus area of T-beam section. One can see that for an increase in area of the T-beam section, the increase in section modulus is small for some of the T-beam sections. Therefore, only those above the dotted line of Figure 3 were used for the final selection.

SYMBOL NOMENCLATURE AND DEFINITION

The section properties of combined beam and plate for high strength steels and titanium are given in Appendixes A through D. They are intended to be used in designing ship structures, when the plate is considered to act as one of the flanges of the attached member. Beams are arranged in order of increasing sectional area. The symbols used are defined as follows:

Nomenclature:	Definition
Beam area	Area of beam only in square inches
Beam depth	Depth of beam to the plate in inches
Flange thick	Thickness of beam flange in inches
Flange width	Width of beam flange in inches
Inertia	Moment of inertia of combined beam and plate in inch
Nominal size	Beam designation for built-up beamsweb depth times flange width times thickness of web/thickness of flange
R	Radius of gyration of combined beam and plate in inches
Shear area	Shear area of combined beam and plate (depth of beam plus plate thickness times thickness of web) in square inches
Web thick	Thickness of web in inches
Wt/ft	Weight per foot of beam only, in pounds per foot, based on unit weight of 0.283 pound per cubic inch (1b/in. 3) for steel and 0.160 lb/in. 3 for titanium

Nomenclature:	Definitioncontinued
YF	Distance from neutral axis to the beam flange in inches
YP	Distance from neutral axis to the plate in inches
ZFL	Section modulus to the flange in cubic inches
ZPL	Section modulus to the plate in cubic inches

ACKNOWLEDGMENTS

The authors would like to express their thanks to Messrs. Frank Lev and Ronald Walz for their assistance and helpful discussions during this study. Also, thanks to Messrs. Peter Roth, Daniel Gill, and Christopher McManus for their guidance with the computer programing.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 28.77     

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 13.00                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | .750
